What Is the Google Hacking Database?

The GHDB is a curated list of **Google search queries (dorks)** that reveal sensitive information unintentionally exposed online. These queries exploit how Google indexes web content.

Discover Exposed Login Admin Pages

The screenshot shows a Yahoo search results page for the query `intitle:Login inurl:admin`. The search bar at the top contains the query, and the results list below shows several search results. The first result is from [www.wikihow.com](https://www.wikihow.com/Login-to-a-Website-as-an-Admin) titled [How to Login to a Website as an Admin \(with Pictures\) - wikiHow](#). The second result is from [app.betterimpact.com](https://app.betterimpact.com/Login/Admin) titled [Better Impact Administrator Login](#), which is highlighted with an orange box. The third result is from [www.exploit-db.com](https://www.exploit-db.com/ghdb/7149) titled [inurl "/admin/index.php" username=admin&password=password](#).

Description:

It fetches the webpages whose title has the word **“Login”** and has **“admin”** in their URL. This further helps in identifying admin entry points for further OSINT or testing.

Find Exposed Password Files

The screenshot shows a web browser window with the address bar displaying a Yahoo search URL. The search bar contains the query 'filetype:txt intext:"password"'. Below the search bar, the results are categorized by 'All', 'Images', 'Videos', 'News', and 'More'. The search results show 'About 583 search results'. The first result is from 'usergrid.apache.org' with the title 'Reset Password - The Apache Software Foundation'. The second result is from 'www.fundflowmanagers.com' with the title 'www.fundflowmanagers.com'. A red arrow points to this result. The third result is from 'www.drupal.org' with the title 'Drupal - Open Source CMS | Drupal.org'. The fourth result is from 'dl.enpass.io' with the title 'dl.enpass.io'. On the right side, there are related search suggestions: 'intext', 'intext', 'allint', 'intext', and 'allint'.

filetype:txt intext:"password"

Description:

This query reveals publicly accessible `.txt` files containing the word "**password**", indexed by Google. These files may contain:

- Default or hardcoded credentials
- Sample scripts or configuration dumps
- Backup files or developer notes
- Sensitive strings accidentally left open to the public.

Expose Webcams or IoT Devices

The screenshot shows a Yahoo search interface. The search bar contains the query `inurl: /view.shtml`. The search results show approximately 71,200 results. The first result is from `insecam.org` and is titled "Live cameras: Axis" with a green checkmark icon. Below the title, it says "Thousands of checked online cameras: Axis .Most popular Manufacturers Countries Places Cities Timezones New online cameras FAQ Contacts". The second result is from `windospc.com` and is titled "How to View Live Cameras from Around the World - WinDOSPC" with a green checkmark icon. The third result is a thumbnail image of a live camera feed showing a grid of multiple camera views, with the caption "Live camera in San Diego, United States". The fourth result is a thumbnail image of a live camera feed showing a road scene, with the caption "Live camera in New York City, United States". The fifth result is a thumbnail image of a live camera feed showing a parking lot, with the caption "Live camera in Holland, United States".

Description:

This query targets URLs that lead to publicly accessible webcam interfaces — often devices using **webcam software like Axis or Panasonic** that serve video feeds through the `/view.shtml` page. These are typically **IP cameras** or **IoT surveillance systems** that are:

- Misconfigured with default credentials
- Exposed directly to the internet
- Not protected by authentication

The result pages often show **live camera feeds** or control panels.

Search for Vulnerable PHP Pages

The screenshot shows a web browser window with a single tab titled 'inurl: php?id= - Yahoo Search R'. The address bar displays the URL 'https://uk.search.yahoo.com/search;_ylt=Awr.oPH.k3toEAIAyuoM34IQ;_ylc=X1MDMTM1MTIxMjgxMgR'. The search bar contains the query 'inurl:"php?id="'. Below the search bar, there are tabs for 'All', 'Images', 'Videos', 'News', and 'More', with 'All' selected. The results show 'About 6,080,000 search results'. The first result is from 'stackoverflow.com' with the title 'how to get id from URL using php - Stack Overflow' and a green checkmark. The snippet mentions a 'detail.php' page and a URL like 'http://www.embryoohotel.com/room-detail'. Below the snippet, there are three boxes with PHP code snippets. The second result is from 'www.embryoohotel.com' with the title 'EMBRYO HOTEL | PATTAYA' and a green checkmark. The snippet describes the hotel's features. The third result is from 'webmasters.stackexchange.com' with the title 'questions' and the number '145069'.

how to get id from URL using php - Stack Overflow ✓

and i also have a detail.php page. I need to get the \$ido value from the URL so that I can use it in the detail.php page to retrieve information from the database. The detail page has a URL like this:...

In your detail.php use: \$id = \$_GET['id']; you can then use \$id around the rest of your page.

You can also use \$_SERVER['QUERY_STRING']; But this will only fetch id=17

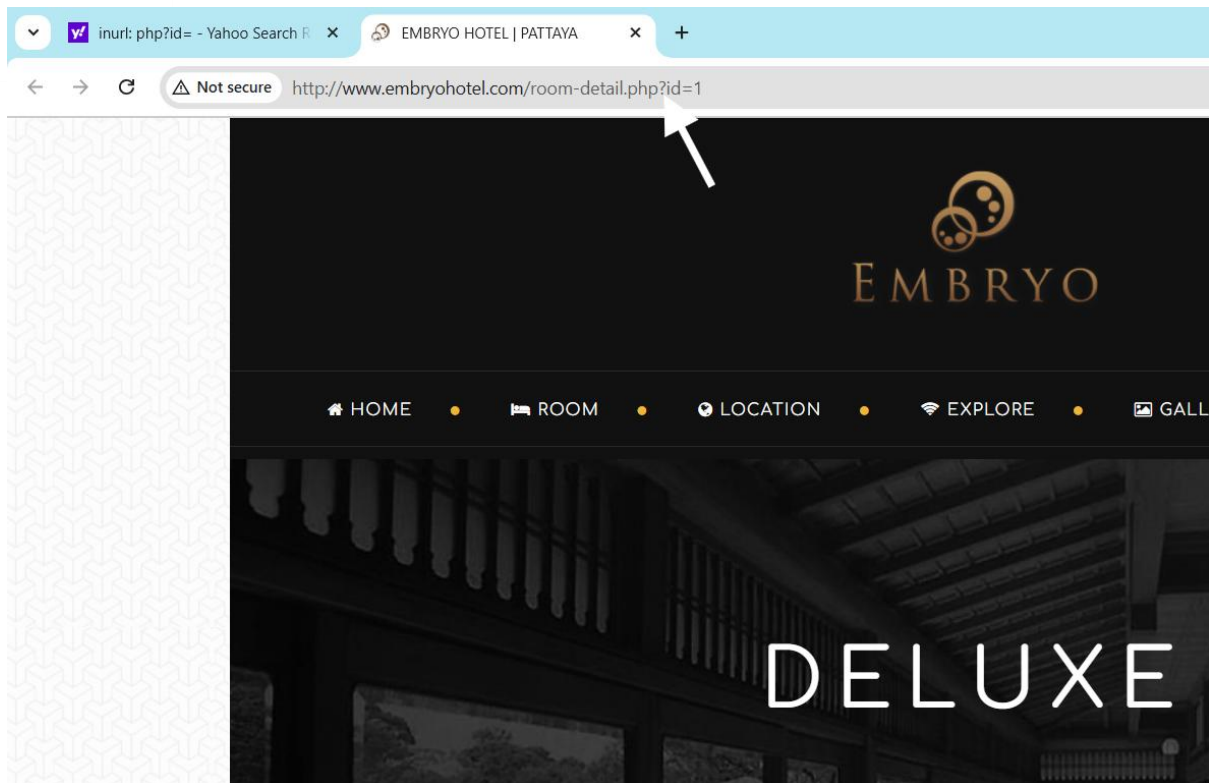

If still having problem then try: To fetch integer value: \$id = intval(\$_GET['id']); To fetch string value: \$name = strval(\$_GET['name']);

webmasters.stackexchange.com › questions › 145069

Description:

This query locates URLs containing the pattern `php?id=`, which is commonly associated with **dynamic web pages** that pull content based on an ID parameter such as articles, product details, or user profiles.

These pages are often built with PHP and may include:

- `view.php?id=1`
- `article.php?id=23`
- `product.php?id=98`

Because the `id=` parameter interacts with a database, it's historically a **common target for SQL injection** or **input manipulation**, especially if user input isn't sanitized properly
